Description of methodology (methods, tools & material used, etc)

ISDP's Malaria program is to ensure by 2023, children under 5, male and female adults living in malarial areas have access to appropriate malaria prevention, diagnosis and treatment services decrease the number of Malaria effected people to 1 in 1000.

To ensure these objectives are accomplished ISDP is obliged to implement Malaria BCC activities cooperating with the ministry of health executing Community dialogue, Malaria Field-day, Door-to-door Malaria BCC lessons and Support & supervisions.

ISDP Malaria Project Coordinator and Malaria SBCC field coordinator carryout implementing partner supervision activity at Bosaso, Armo, Wai'ye, Gardo, Dangorayo and Garowe. districts and the field visit take 7 days from 4 to 10 of Nov 2023.

During supervision.

The ISDP team met with health workers in the areas they visited and explained the purpose of their visit by sharing the malaria situation in Puntland and how to encourage community early diagnosis, treatment, prevention and control. we also met with malaria educators in the areas they visited and listened to how activities going on, their outreach work and if there are any challenges they face during their outreach and home visits

During field visit the supervisors met with Regional Health Officers of supervised location.

We are very grateful to all the staff of the health centres', the community mobilizers for the malaria we met during our field visit for quarterly supervision we met the community mobilizers for health program, we explained BCC activities that we are supervising now and how they as mobilizers take part to eliminate malaria our country.

The period of Supervisors we take short meeting with community Educators, we asked some questions on their activities and it was appreciable the outreach activity they are doing which is monthly basic and we cheered to continue and accelerate especial this rainy season because stagnant water during rain contribute malaria breeding sites which increasing mosquito population. We interviewed 20 mothers in household and asked same question of malaria prevention responded right answer that showing 16 out of 20 have knowledge about malaria prevention. But all visited locations the most of the community have less knowledge for Larva of Mosquito and how to manage, Which needs to be taught to the community on how to manage larva of mosquito in their public level.

Supervision Findings.

- The RDTs and ACTs were available at all supervised Health facilities.
- All visited community Educators were at work.
- Community Elders we meet during supervision demanding means of other support intervention.

Constraints

Lack of Motivation among Malaria Community Educators.
Lot of stagnant water at the areas we supervised.

Recommendations

- ISDP Malaria staff will accelerate the community awareness on malaria Diagnosis, Treatment, prevention and control and how to take make preparedness for expecting El nino.
- Increasing acceptance of using mosquito net at every household

END
